

Introducing the new Supplier Portal

A Smarter, Simpler Supplier Experience: Introducing the New Atamis Supplier Portal

We're pleased to introduce the newly redesigned Atamis Supplier Portal, a significant step forward in how procurement teams and suppliers connect, collaborate and deliver outcomes together.

This update has been built with a clear focus: make every interaction faster, more intuitive, and more effective. By simplifying workflows and improving visibility across the platform, the new portal creates a more seamless experience across the entire source-to-contract lifecycle.

What's New and Why It Matters

A cleaner, more intuitive interface

The portal now features a modernised design with improved typography, spacing, and layout. The result is a cleaner, more professional experience that makes information easier to scan and act on.

Simplified page structures reduce cognitive load, helping users quickly find what they need without unnecessary complexity. And with full responsiveness across desktop, tablet and mobile, the experience is consistent wherever you're working.

Faster navigation, fewer clicks

Time matters, especially in procurement.

We've significantly reduced the number of steps required to complete key actions such as bid evaluations and document reviews. Clear visual indicators highlight priorities and next steps, while a centralised navigation hub provides quick access to supplier records, opportunities and communications.

More effective communication and auditability

Supplier collaboration is now more structured and transparent.

Messaging workflows have been refined to make composing, tracking and responding to conversations more intuitive. At the same time, enhanced communication logs provide a clearer, more complete audit trail, supporting both governance and accountability.

Improved attachment handling also ensures smoother performance, even when managing high volumes of supporting documents.

High-performance document management

Working with documents is now faster and more consistent.

Users will benefit from improved loading speeds, smarter filtering, and enhanced file preview capabilities, making it easier to review and download documents without disrupting workflow.

Standardised naming and sorting conventions also bring greater consistency across projects.
